

TSEA44: Computer hardware - a system on a chip

"dafk"
"tsea21"
"tsea02"

Olle Seger, Joar Sohl, Andreas Karlsson,
<http://www.da.isy.liu.se/courses/tsea44/>

What is the course about?

- How to build a complete embedded computer using an FPGA and a few other components. Why?
- Only one chip
- The computer can easily be tailored to your needs.
 - Special instructions
 - Accelerators
 - DMA transfer
- Debug unit during development
- The computer can be simulated
- A logic analyzer can be added in the FPGA
 - Chipscope
 - Add performance counters
- It's fun!

Prerequisites

You will definitely need a thorough understanding of

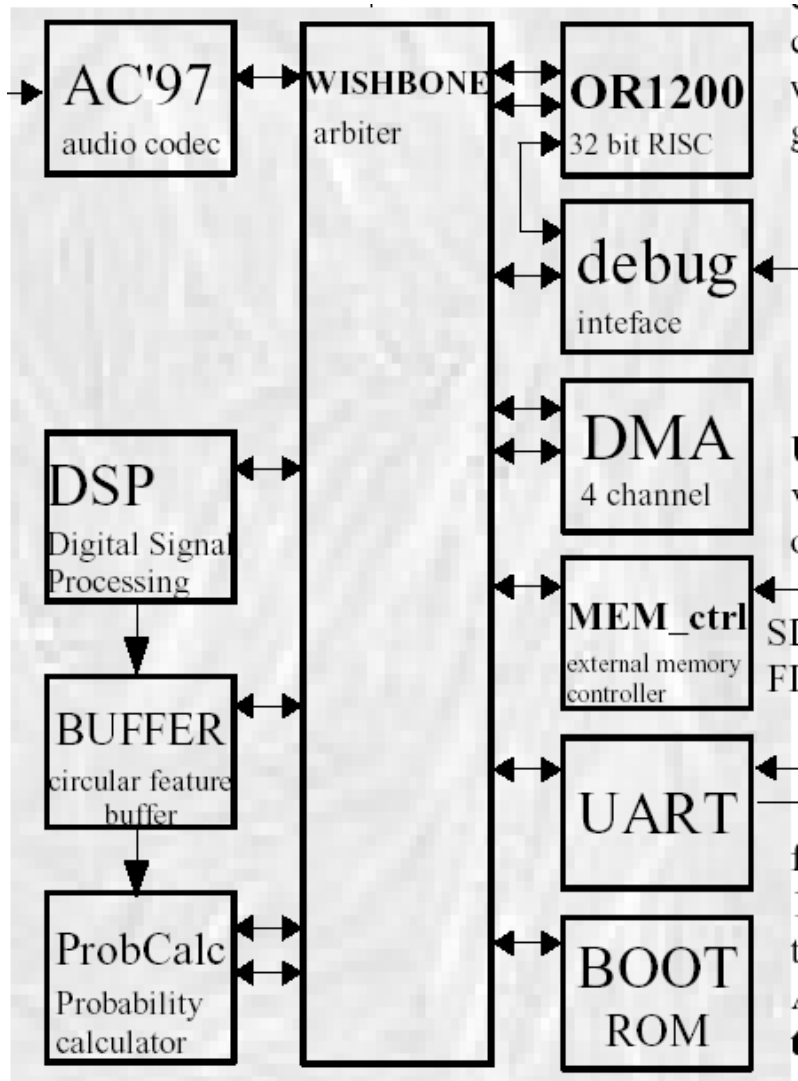

- * *Digital logic design*. You will design both a data path and a control unit for an accelerator.
- * *Binary arithmetic*. Signed/unsigned numbers.
- * *VHDL or Verilog*. SystemVerilog (SV) is the language used in the course.
- * *Computer Architecture*. It is extremely important to understand how a CPU executes code. You will also design part of a DMA-controller. Bus cycles are central.
- * *Asm and C programming*. Most of the programming is done in C, with a few cases of inline asm.

Success story:

Speech recognizer into silicon

Voxi has successfully implemented a speaker independent **speech recognizer** as an IP core called VoxIC. The design is based on Open-Cores IP in combination with specially developed functions for the application. The core is targeted for both FPGA and ASIC devices.

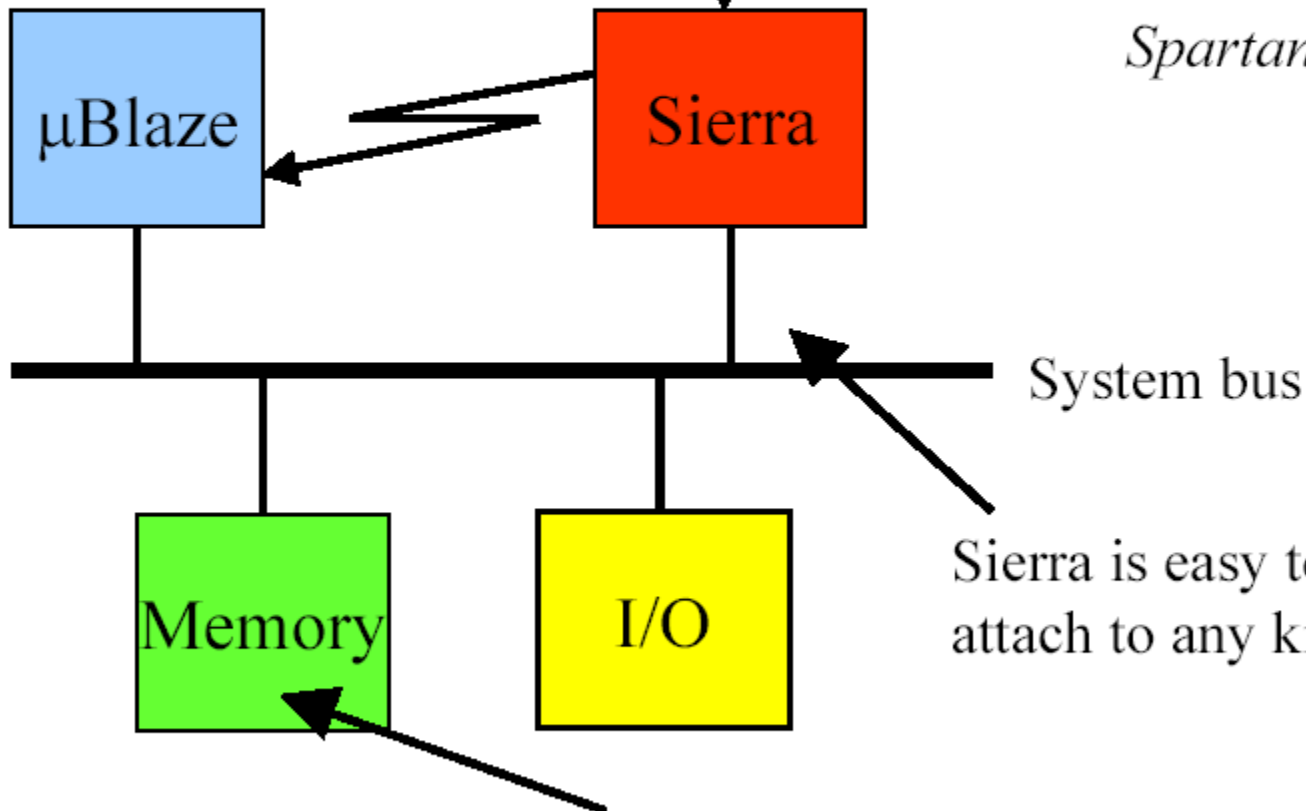

Michael Unnebäck

RTOS acceleration

All interrupts to the CPU are replaced by a single "taskswitch interrupt"

external interrupts

*This system fits in a
100k gate
Spartan IIe FPGA*

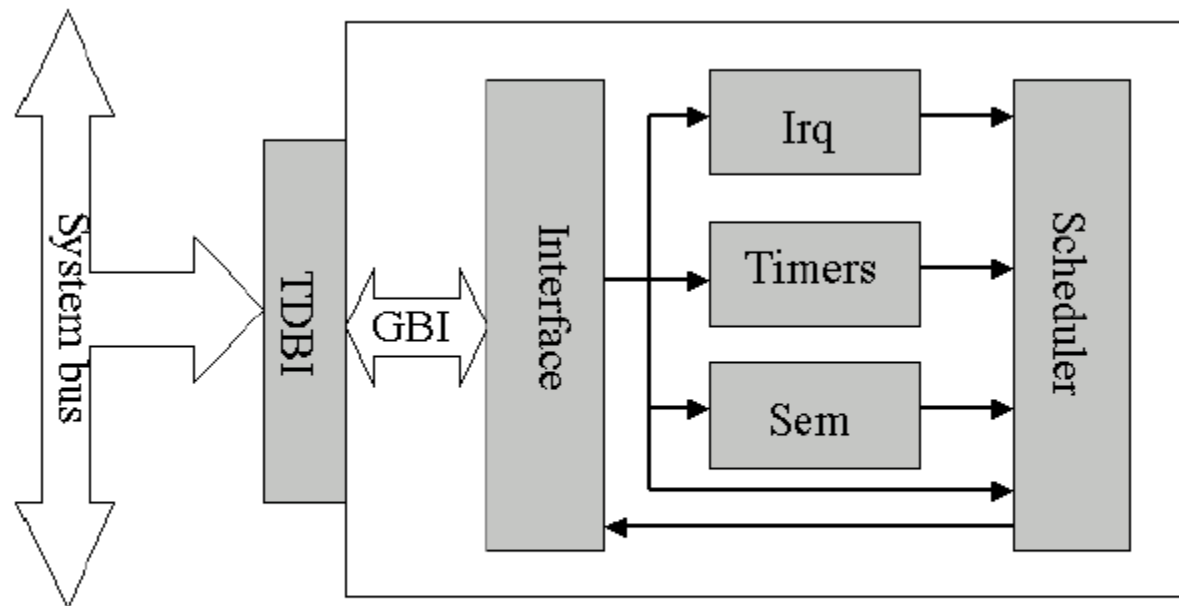

Sierra is easy to attach to any kind of bus

A SW-driver utilizes the functions in the HW RTOS

RTOS acceleration

The Sierra 16 chip supports:

- 16 Tasks at 8 priority levels
- 16 Binary Semaphores
- 8 External Interrupts
- Timers - delay, periodic tasks

GBI = Generic Bus Interface

TDBI = Technology Dependent Bus Interface

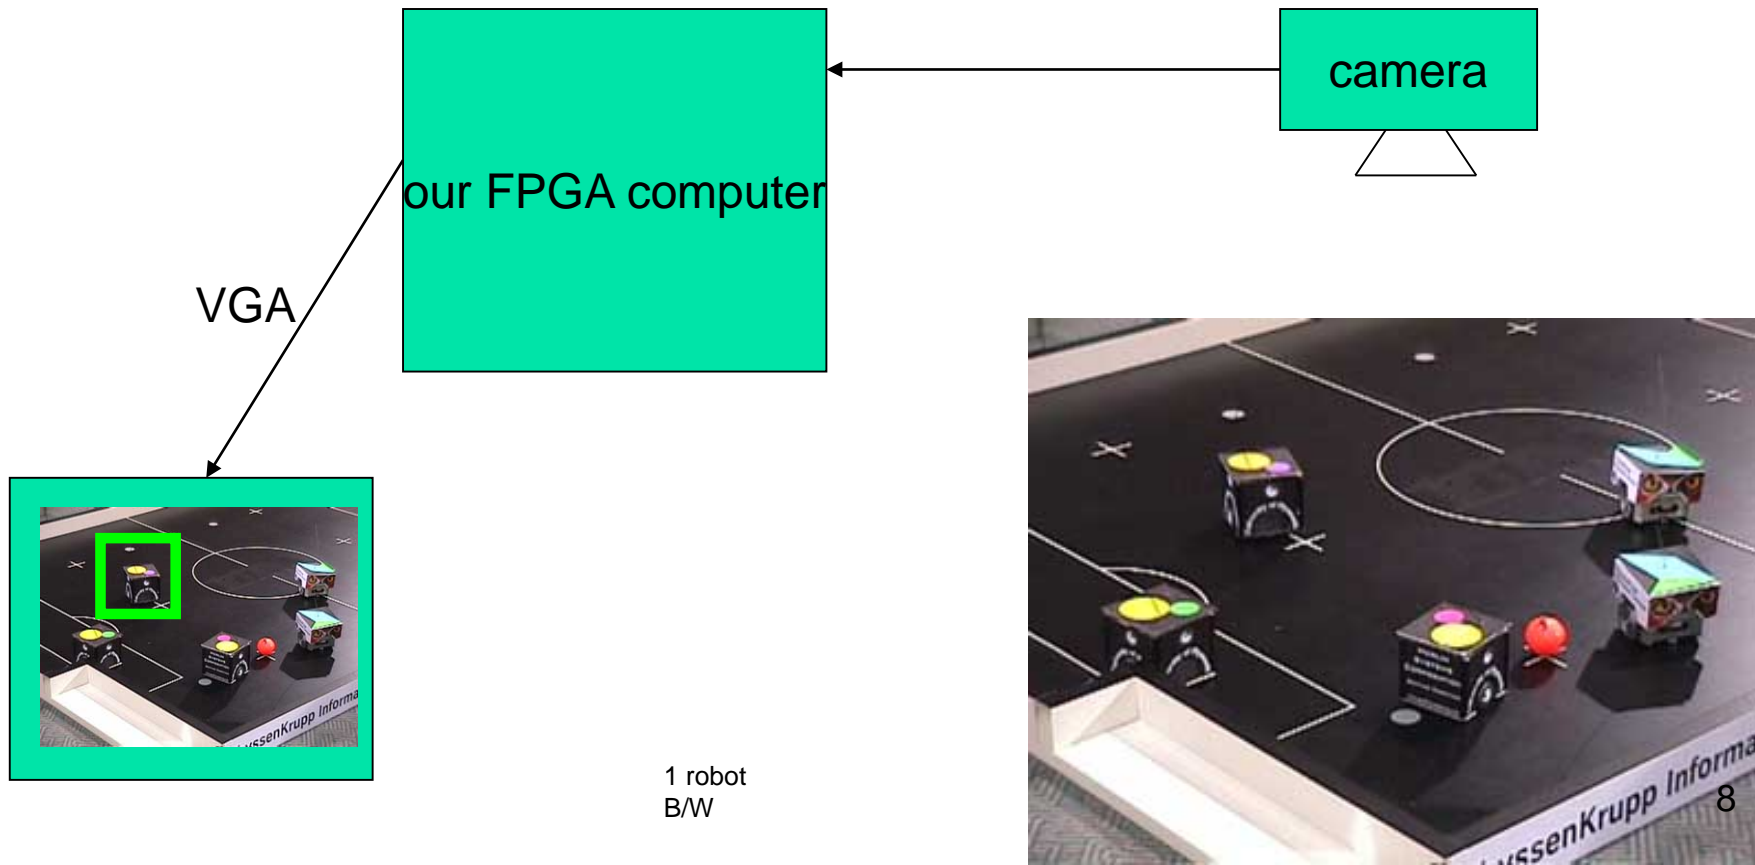

Figure: Overview of internal blocks in Sierra 16

Course organisation

- Lab course: 4 mini projects
 - 6 groups * 3 students in the lab
- Lab 0: learn enough Verilog, 4 hours
- Lectures: 8*2 hours
- Examination 6CPs:
 - 3 written reports/group
 - oral individual questions

The lab course is based on an application 2004 - tracking

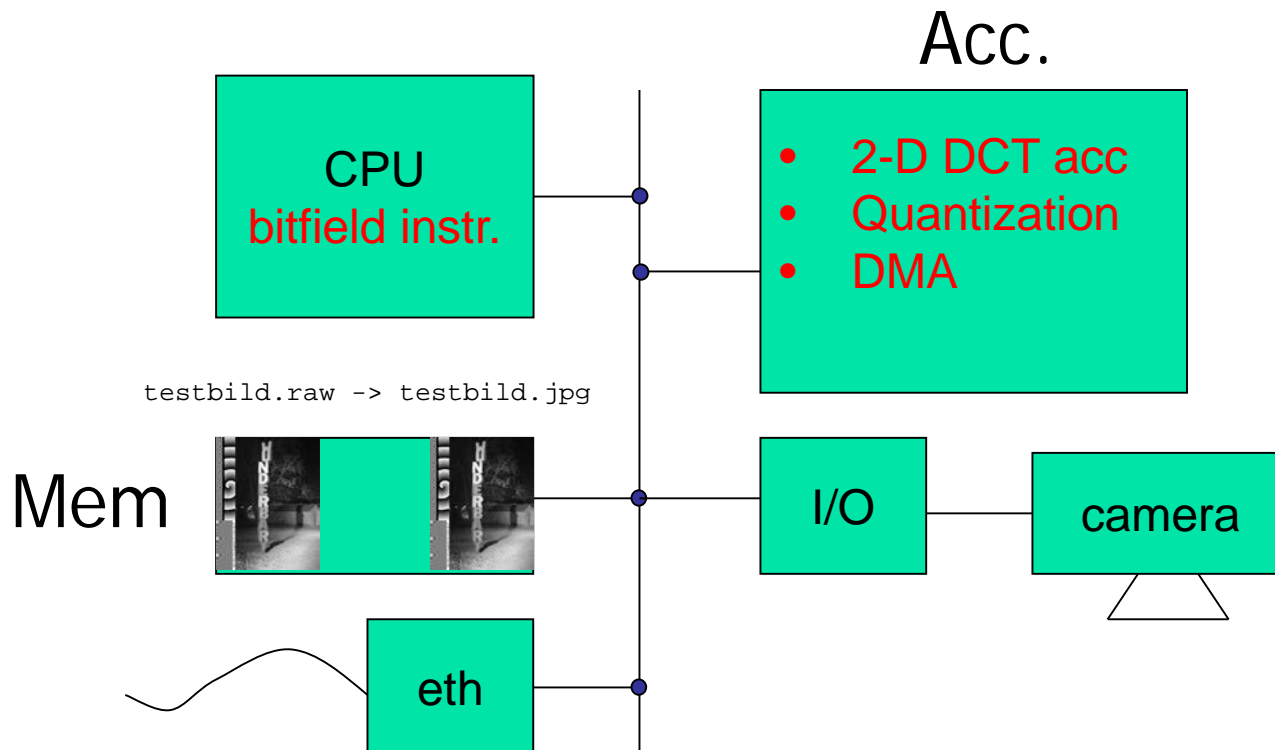

The application is inspired from a robot football web page:
<http://www.tech.plym.ac.uk/robofoot/>

The lab course is based on an application

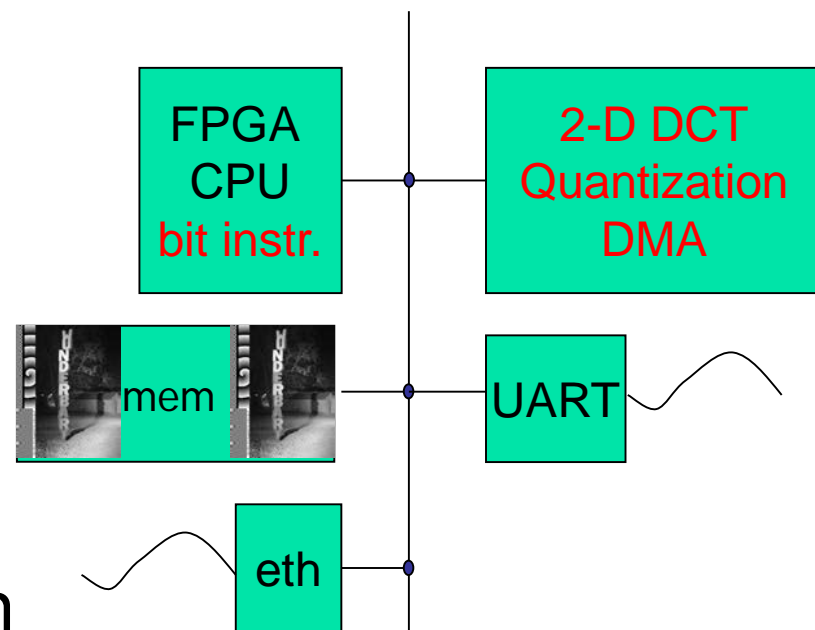

2005-14 - JPEG compression

- Take 2-D DCT on 8x8-blocks
- Quantize = Divide and set small values to zero
- RLE + Huffman code

Lab info

- 0) Build a UART in Verilog
- 1) Interface your UART
 - Test performance counters
 - Test a SW-DCT2 application

- **2+3) Build a HW accelerator for 2-D DCT and add a DMA controller**
- **4) Design your own instruction to handle bit fields**

- Your group shall send in 3 written lab reports, preferably in pdf. Same rules apply here, no plagiarism!

Lab nr	Lab task	Examination
0	Build a UART in Verilog	Demonstration
1	Interfacing to the Wishbone bus	Demonstration Written report
2+3	Design a JPEG accelerator + DMA	Demonstration Written report
4	Custom Instruction	Demonstration Written report

Demonstration = presentation of working design. We ask individual questions!

Written report = a readable short report typically consisting of

- **Introduction**
- **Design**, where you explain with text and diagrams how your design works
- **Results**, that you have measured
- **Conclusions**
- **Appendix** : All Verilog and C code with comments!

Competition - fastest JPEG compression

- An unaccelerated JPEG compression (using `jpegfiles`) takes roughly 13,0 Mcycles (25 Mhz).
- Our reference implementation takes 5,5 Mc, almost 5 fps (DCT in HW, with Q, DMA, bit field instruction)

wunderb.jpg
320 x 240

wunderbart-tårtan
At least 7 fps with lowest cost

Communication & Memory Module

Main Board

Projects by category

We use a few icons to help identify projects:

-  Indicates new project, that has been added in the last 30 days
-  Indicates project that is ready to use
-  Indicates a WISHBONE Compliant Core

Click on category to see only its projects

Note: language filter doesn't work very well yet because most of projects don't have this property set. We are asking developers to set it.

Projects/cores: Ready to be used and Wishbone compliant and written in any language

Arithmetic core

(System)Verilog!

- The course uses (System)Verilog!
- Verilog is easy to learn if you know VHDL/C
- Our soft computer (80 % downloaded from OpenCores) is written in Verilog
- It is possible to use both languages in a design
- You need to understand parts of the computer

verilog ↔ VHDL

an edge-triggered D-flip/flop

C-like syntax

```
module dff(  
    input clk, d,  
    output reg q);  
  
    always_ff @(posedge clk)  
        q <= d;  
  
endmodule
```

Ada-like syntax

```
entity dff is  
    port (clk,d : in std_logic;  
          q: out std_logic);  
end dff;  
  
architecture firsttry of dff is  
begin  
    process (clk) begin  
        if rising_edge(clk) then  
            q <= d;  
        end if;  
    end process;  
end firsttry;
```

verilog ↔ VHDL

let's use our D-flip/flop, instantiation

```
// instantiation
```

```
wire a,b,c,grr;
```

```
...
```

```
dff ff1(.clk(c),.d(a), .q(grr));
```

```
dff ff2(.clk(c), .d(grrr), .q(b));
```

Watch out! Verilog allows implicit declarations

You get a lab skeleton!

- **dafk_tb.sv** . Testbench.
- **dafk_top.sv** . To be synthesized in the FPGA.
 - . **eth_top.sv**. Ethernet controller.
 - . **pkmc_top.sv**. Memory controller.
 - . **or1200_top.sv**. The OR1200 CPU.
 - . **parport.sv**. Simple parallel port.
 - . **romram.sv** . The boot code resides here.
 - . **uart_top.sv** . UART 16550.
 - . **dvga_top.sv** . VGA controller.
 - . **wb_top.sv** . The wishbone bus.
- **eth_phy.v** . Simulation model for the PHY chip.
- **flash.v** Simulation model.
- **sdram.v** Simulation model.
- **sram.v** . Simulation model.

The Wishbone bus

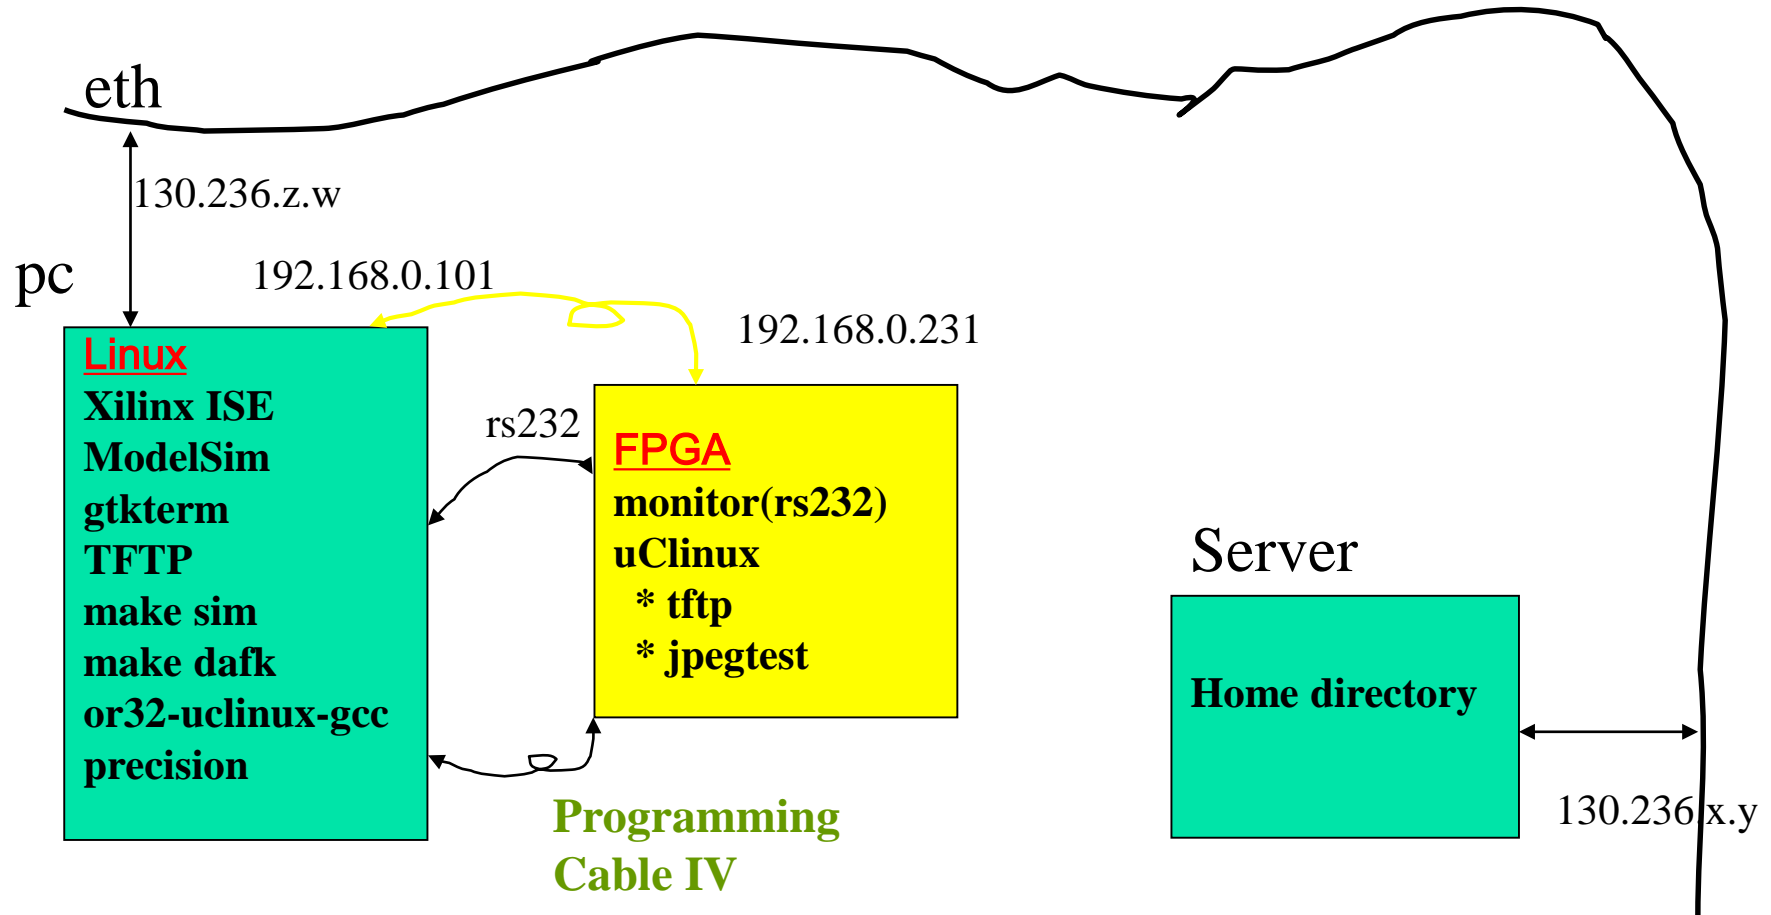

A multi-master bus

- Signals: adres (32), dat_out(32), dat_in(32), control
- Two data buses and muxes are used instead of tristate

"The environment"

- We prefer linux (centos) but you can also use windows
 - Compile uClinux only on linux

Software under linux

- C-compiler (GNU tool chain)

- `or32-uclinux-gcc`

- Software simulator

- `or32-uclinux-sim`

- a very simple boot monitor
(24 kB ROM + 8 kB RAM
inside FPGA)

- `dct_sw, dma_dct_sw, jpegtest`

- μ Clinux boots from flash

- `jpegtest`

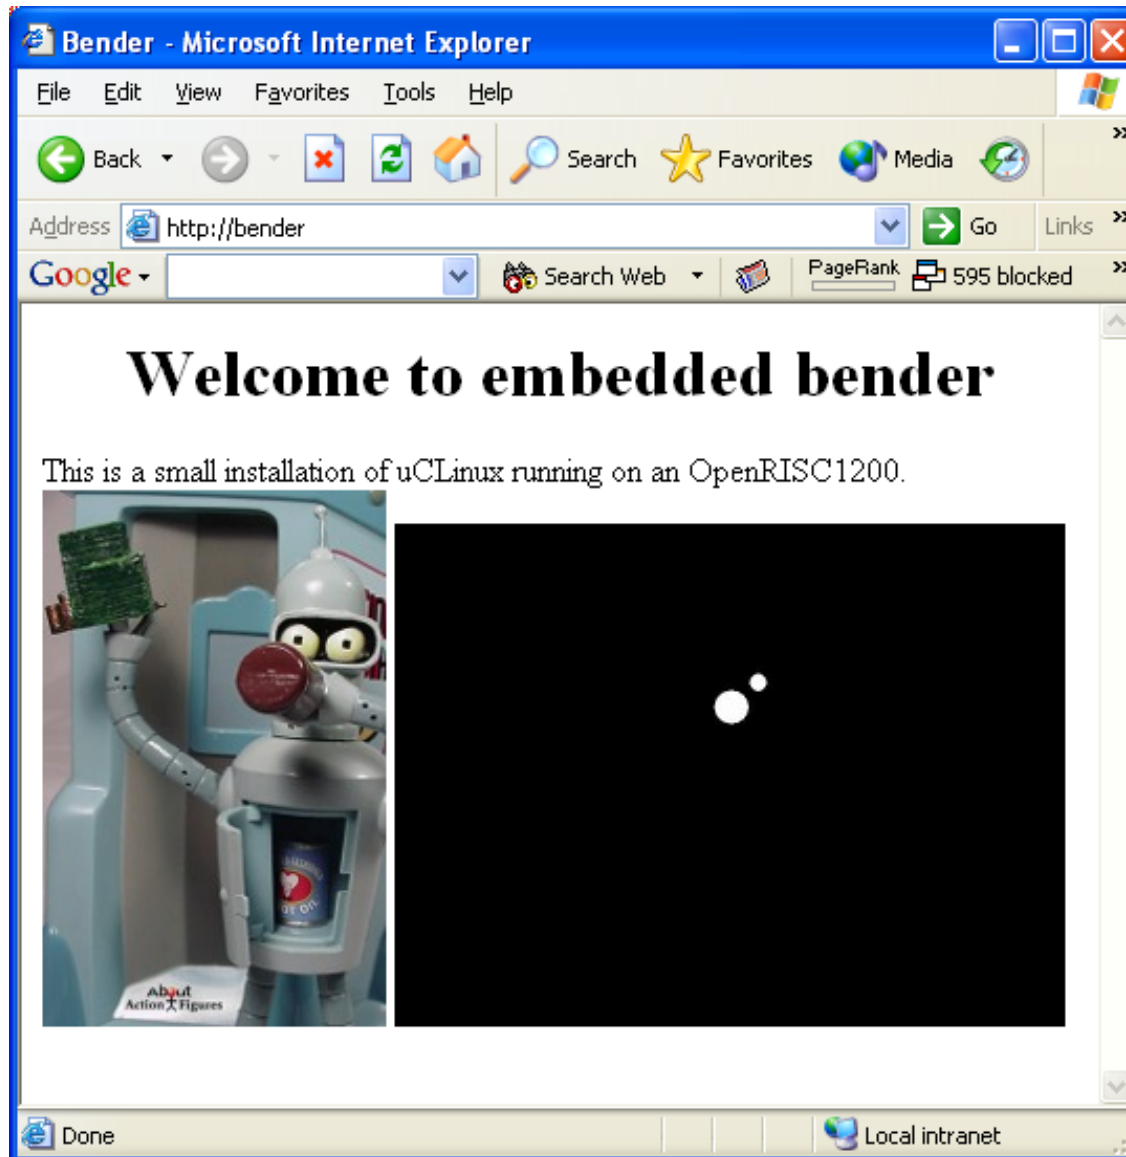

host

Books

Lilja, Sapatnekar: *Designing Digital Computer Systems with Verilog*, Cambridge University Press

Sutherland et al: *SystemVerilog for Design*, Springer

Spear: *SystemVerilog for Verification*, Springer

How I built my first FPGA computer

- 1) Download CPU OR1200, roughly 60 Verilog files (tar/svn)
- 2) Download Wishbone bus 3 Verilog files
- 3) Download UART 16550, 9 Verilog files
- 4) Figure out a computer

How I built my first FPGA computer

5) Write top file ("wire wrap in emacs")

Size 35kB in Verilog, 13 kB in SV

(Verilog does not have struct)

```
module myfirstcomputer(clk,rst,rx,tx)
  input clk,rst,rx;
  output tx;

  wishbone Mx[0:1], Sx[0:1];

  or1200cpu cpu0(.iwb(Mx[0]), ... );
  wb_conbus wb0(clk, rst, Mx, Sx);
  romram rom0(Sx[1]);
  uart uart0(Sx[0], ...);
end module
```

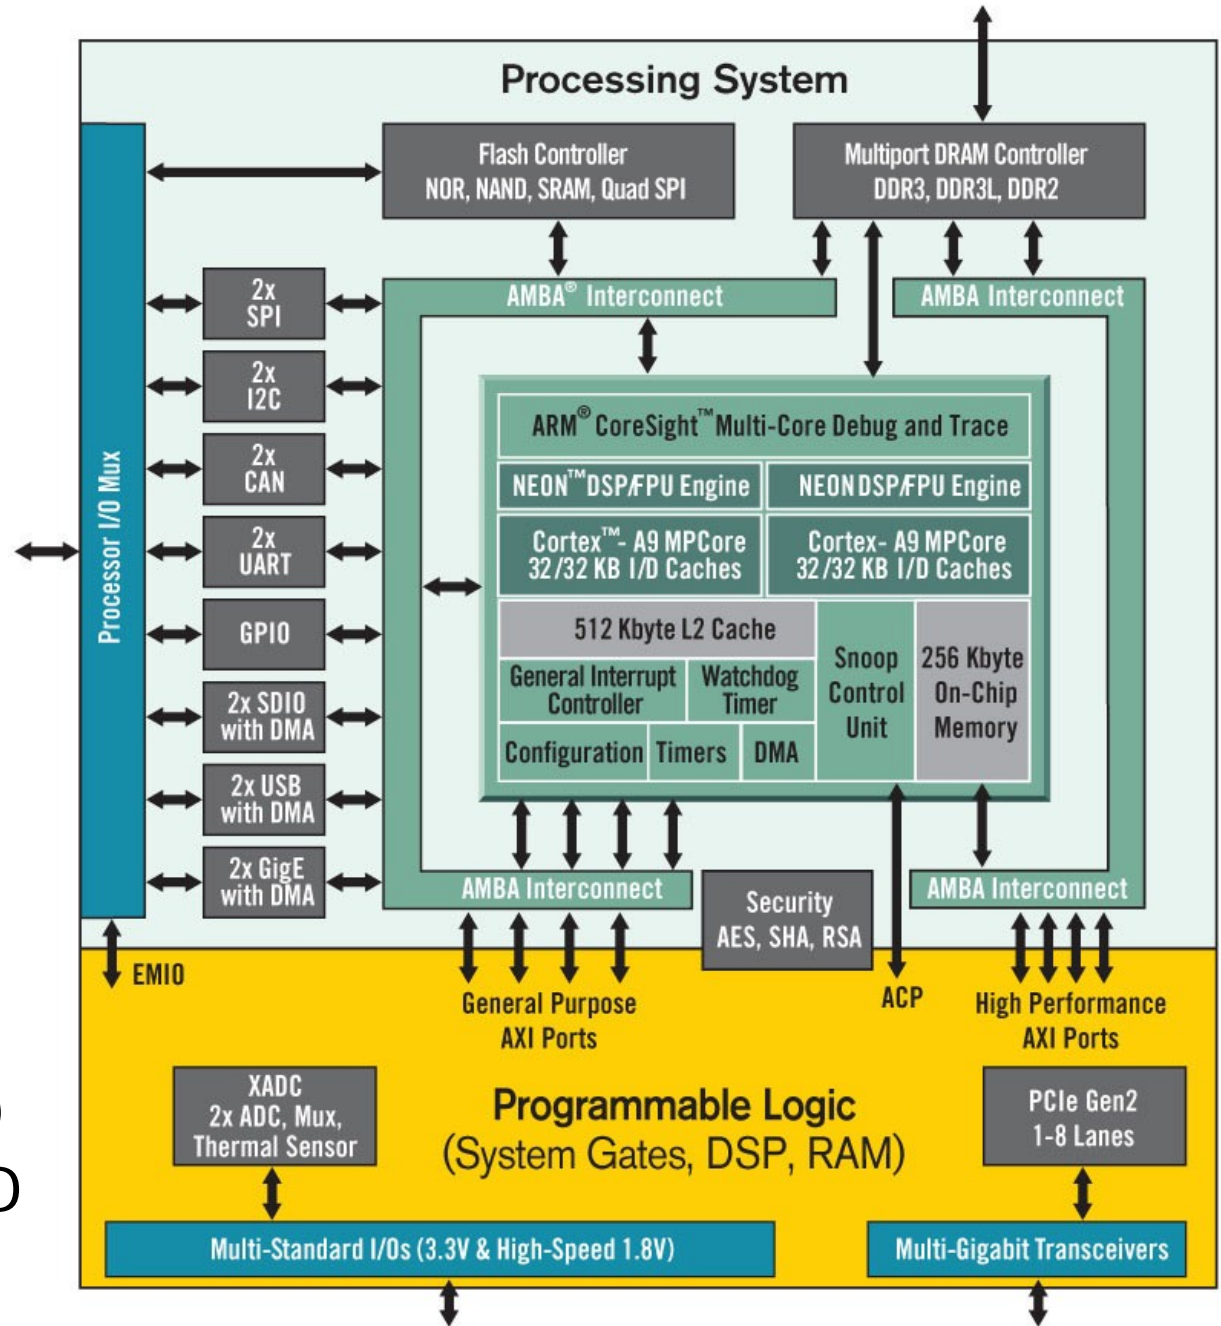

How I built my first FPGA computer

- 6) Download cross compiler
- 7) Write a small monitor and place in ROM
- 8) ModelSim. Does it boot? Anything on tx?
- 9) Test with the simulator or32-uclinux-sim
- 10) Synthesize (10 min)

Zynq7000

- PS:
 - 2 ARM cores
 - AXI busses
 - Interconnects
 - I/O
- PL:
 - FPGA
 - SystemVerilog
- Trouble shooting:
 - Chipscope
 - ACC + AXI BFM
- Software:
 - Real Linux on SD
 - Real Uboot on SD

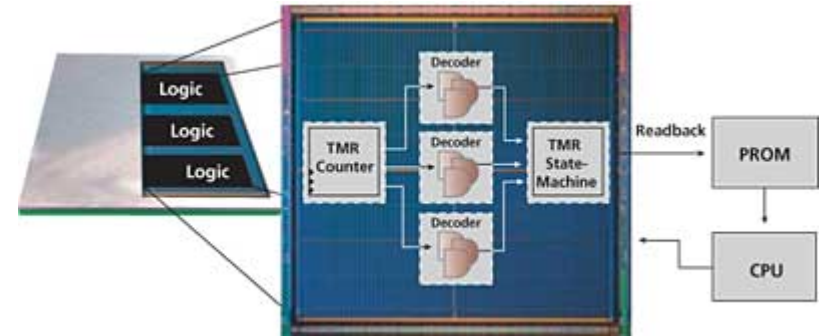

Pros, cons, ...

- + AXI is an advanced, pipelined, hi speed bus
bursts are OK, separate read and write busses
- + The interconnect is a cross-bar (almost)
- + There are 2 real CPUs and real Linux,
easy to thread
- can't use your own instructions
- + - can't simulate CPU, must run Chipscope
- + no need to synth CPU and busses, just acc
- + - must distinguish between physical/virtual
addresses when doing DMA
- + there is a cache coherent port to mem

FPGAs on Mars

4 Xilinx XQR4062 controlling landing pyrotechnics

2 Xilinx VirtexXQVR1000 controlling stepper motors, antennas, cameras

Xilinx - Virtex II Overview

- IOB = I/O-block
- DCM = Digital Clock Manager
- CLB = Configurable Logic Block
= 4 slices
- BRAM = Block RAM
- Multiplier

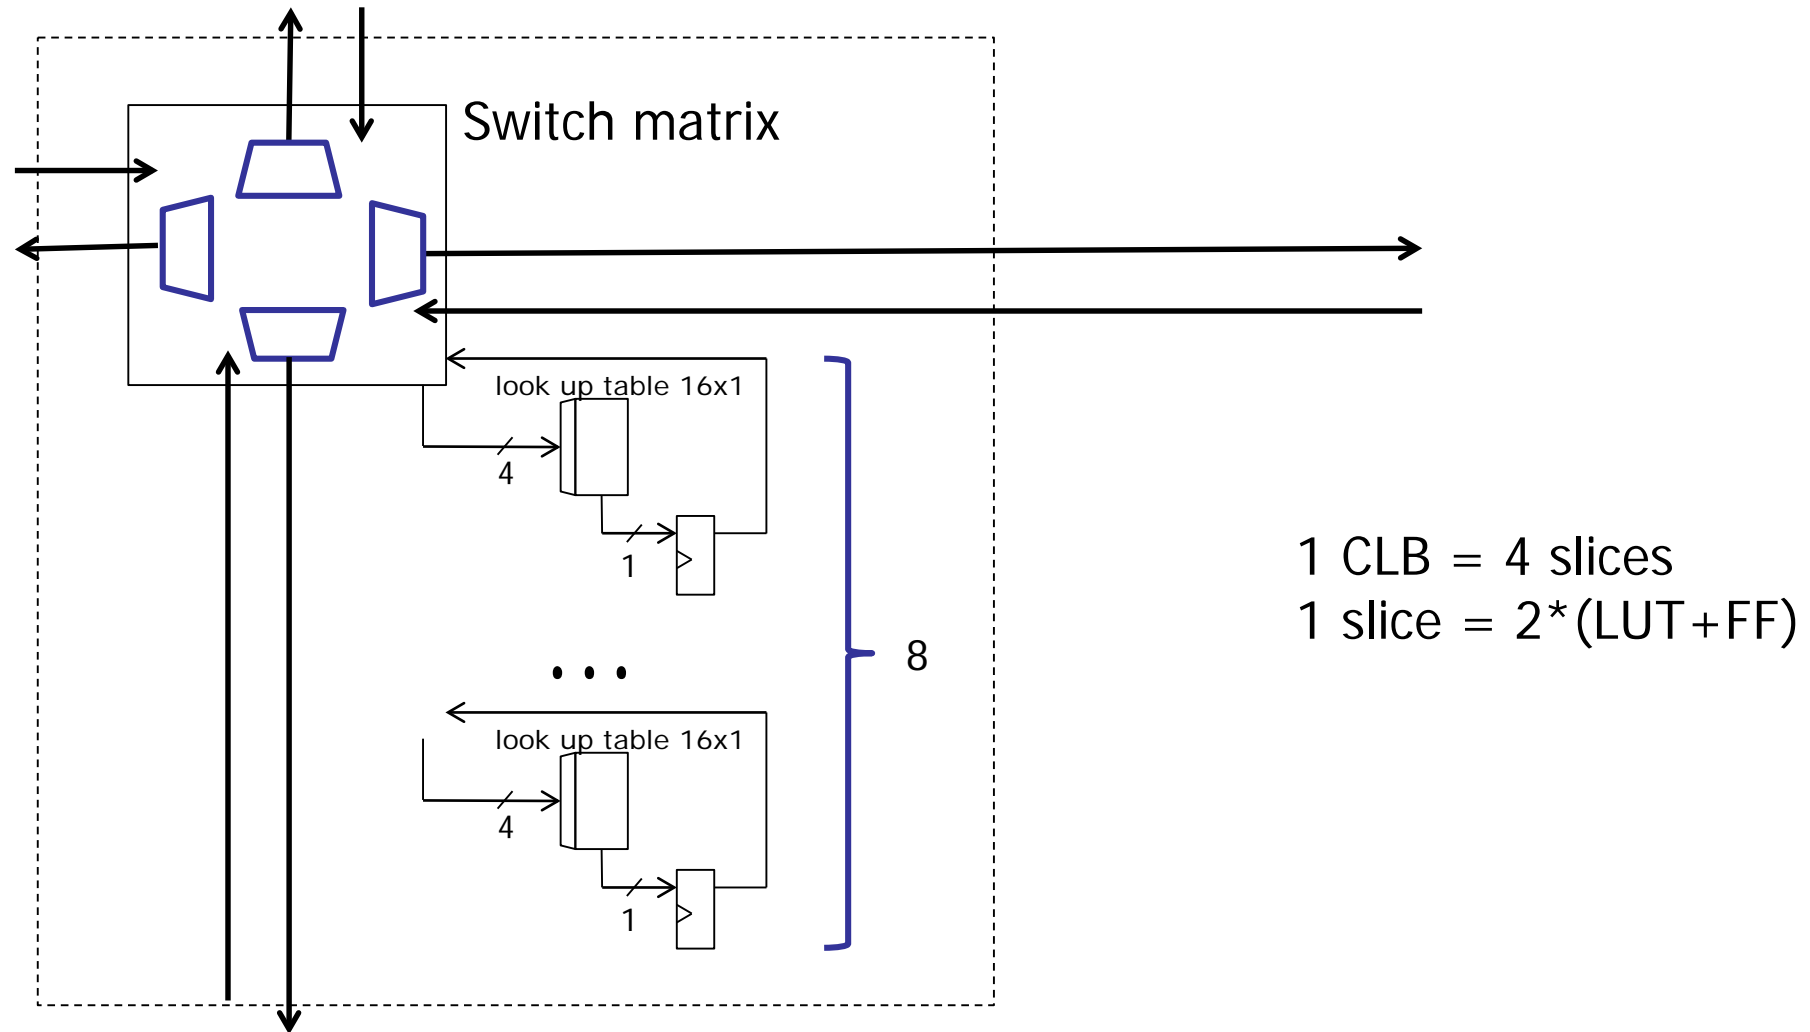

4 Slices per CLB.

1 slice = two F/F + two 4-input LUT

CLB = configurable logic block

LUT = look up table

Our FPGA

Floorplan from FPGA Editor

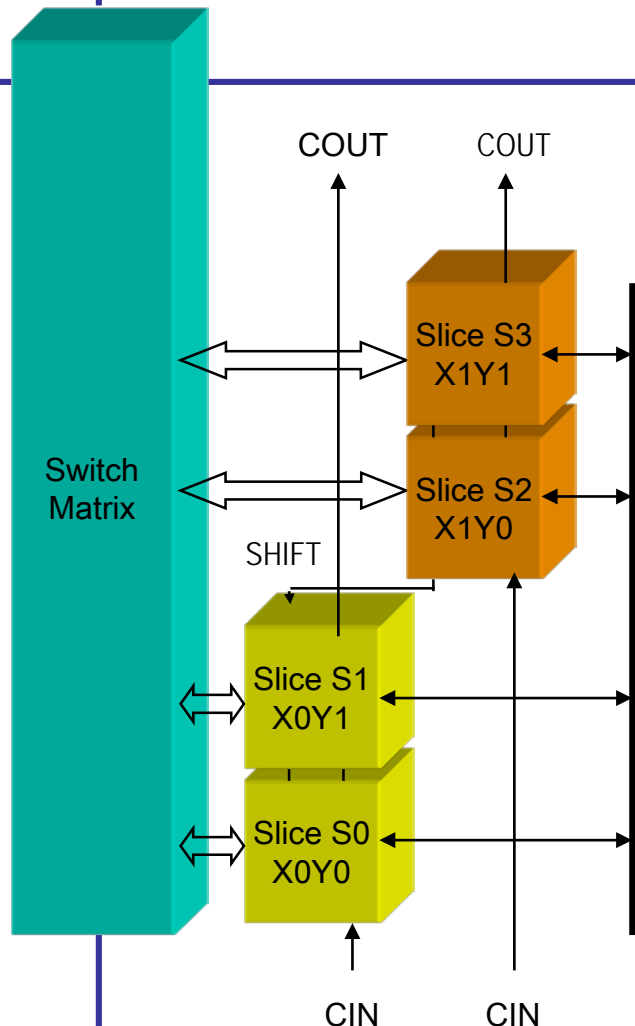

Computer

CPU OR1200

CLB Contains Four Slices

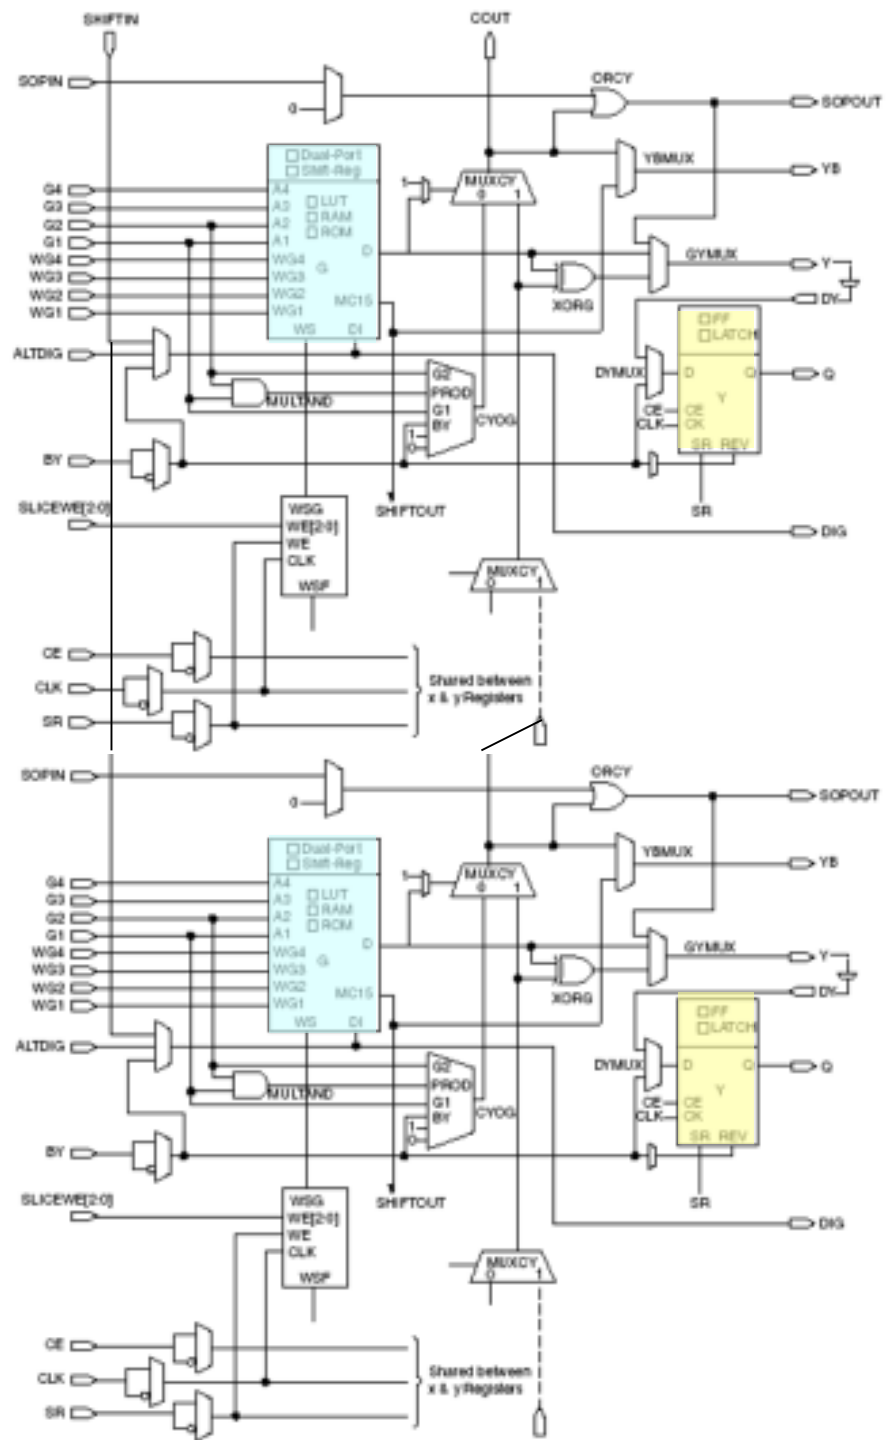

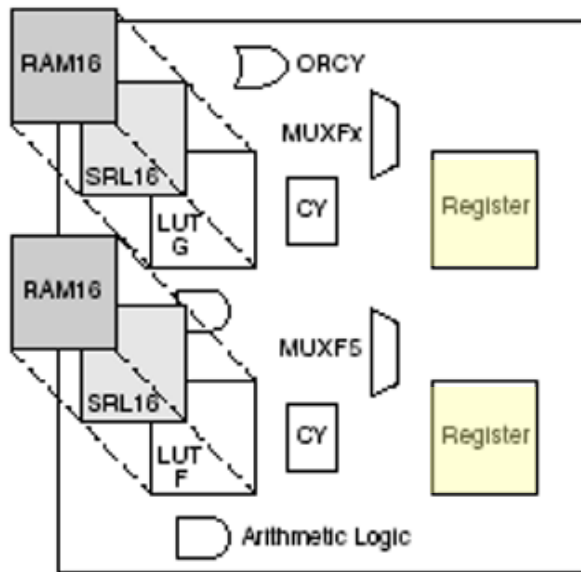

- Each CLB is connected to one switch matrix
 - 1 slice = 2 LUT/FF + ...

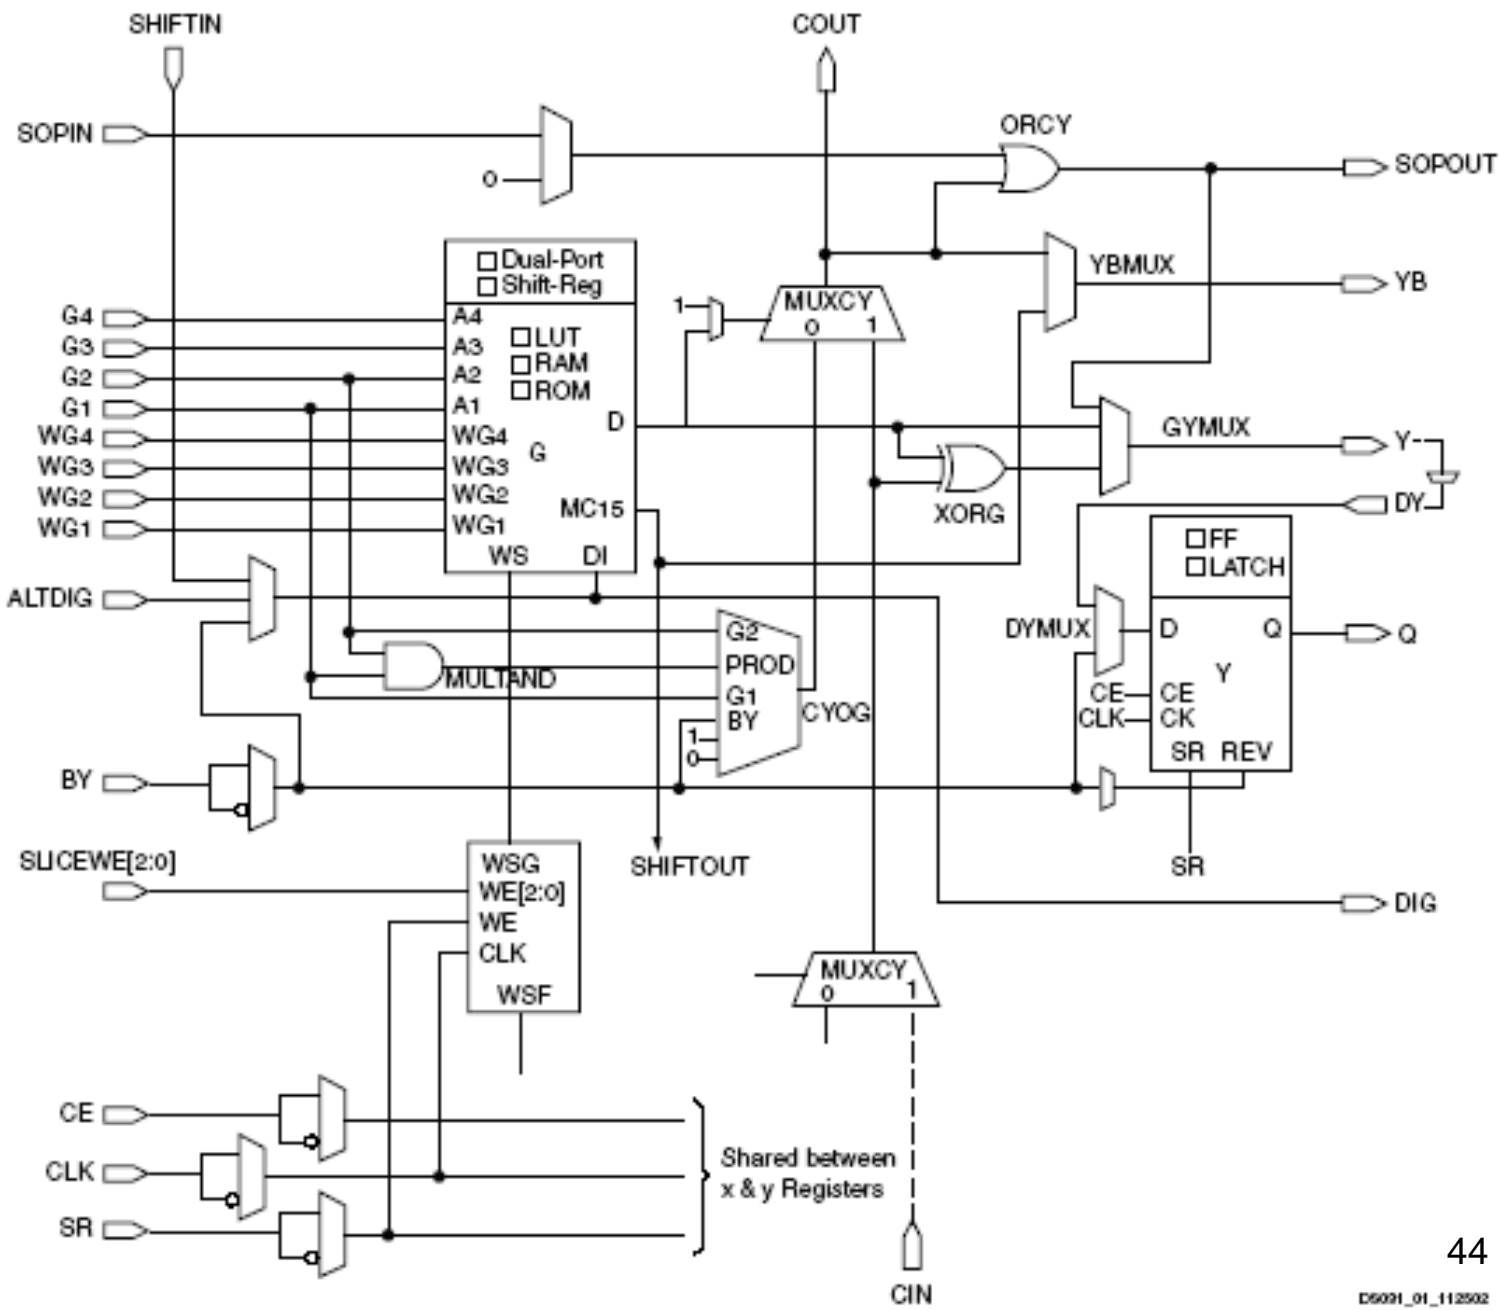

High level of logic integration

- ◆ Wide-input functions:
 - 16:1 multiplexer in 1 CLB
 - 32:1 multiplexer in 2 CLBs (1 level of LUT)
- ◆ Fast arithmetic functions
 - 2 look-ahead carry chains per CLB column
- ◆ Addressable shift registers in LUT
 - 16-b shift register in 1 LUT
 - 128-b shift register in 1 CLB (dedicated shift chain)

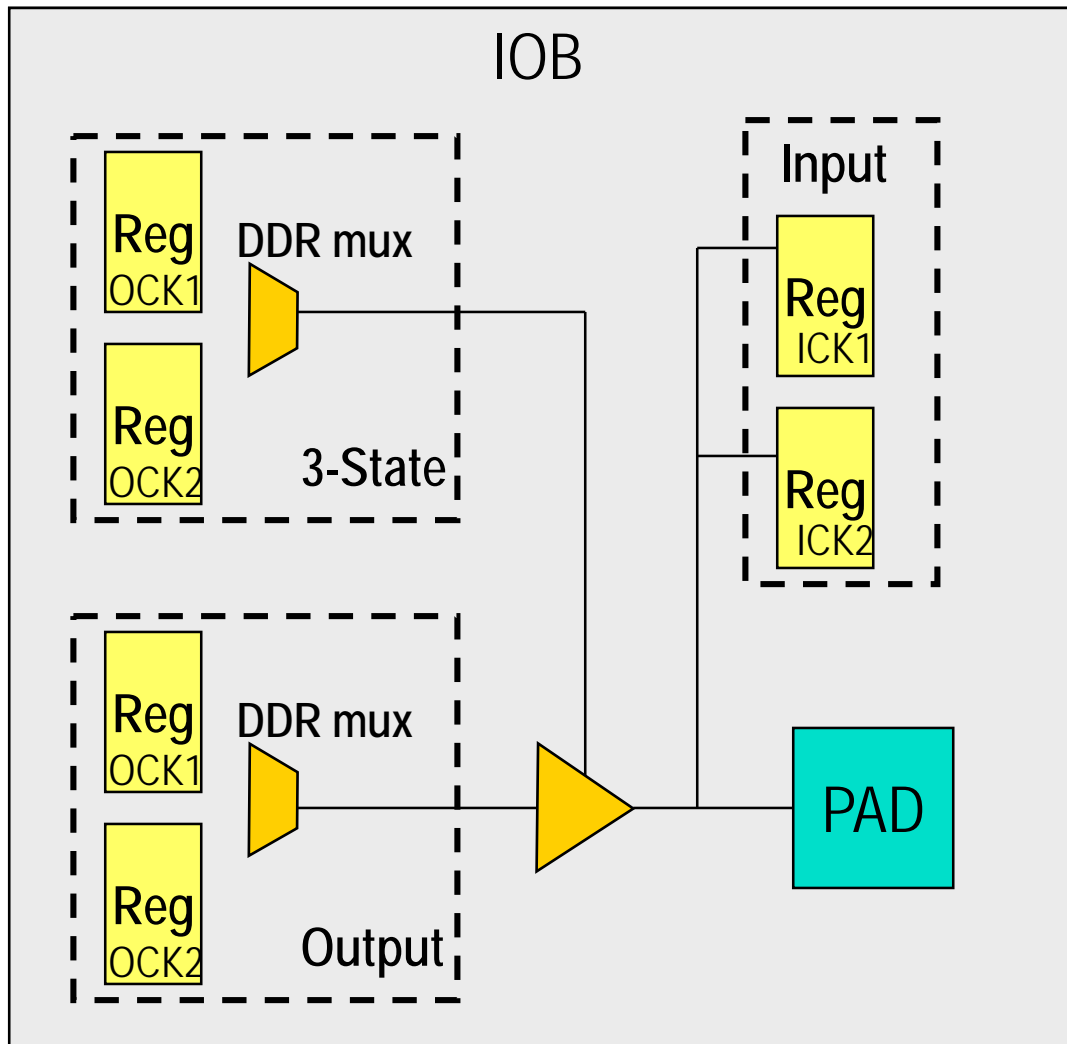

1 slice (out of 23,040)

1/2 slice (top half), out of 46.080

IOB Element

IOB

- Input path
 - Two DDR registers
- Output path
 - Two DDR registers
 - Two 3-state DDR registers
- Separate clocks for I & O
- Set and reset signals are shared
 - Separated sync/async
 - Separated Set/Reset attribute per register

Embedded 18 kb Block RAM

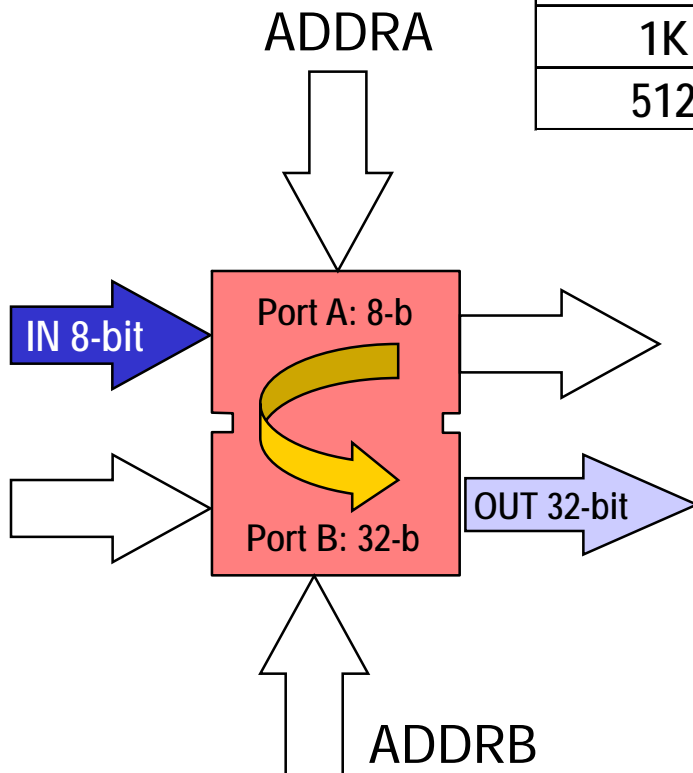

- Up to 3 Mb on-chip block RAM
- High internal buffering bandwidth
- Clocked write **and** read

✓	18Kbit block RAM
✓	Parity bit locations (parity in/out busses)
✓	Data width up to 36 bits
✓	3 WRITE modes
✓	Output latches Set/Reset
✓	True Dual-Port RAM
✓	Independent clock (async.) & control

True Dual-Port™ Configurations

Configurations available on each port:

Configuration	Depth	Data bits	Parity bits
16K x 1	16Kb	1	0
8K x 2	8Kb	2	0
4K x 4	4Kb	4	0
2K x 9	2Kb	8	1
1K x 18	1Kb	16	2
512 x 36	512	32	4

- Independent port A and B configuration:
 - Support for data width conversion including parity bits

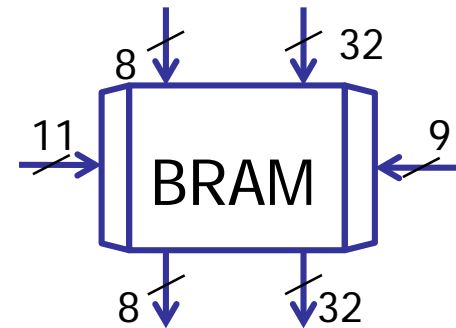

Block RAM :
just instantiate template
2-port 512x32(+4)

How to

```
RAMB16_S36_S36 inmem
  (// port A
    .CLKA(wb.clk), .SSRA(wb.rst),
    .ADDRA(ram_addr),
    .DIA(ram_data), .DIPA(4'h0),
    .ENA(ram_ce), .WEA(ram_we),
    .DOA(doa), .DOPA(),
  // port B
    .CLKB(wb.clk), .SSRB(wb.rst),
    .ADDRB({3'h0,rdc}),
    .DIB(32'h0), .DIPB(4'h0),
    .ENB(1'b1), .WEB(1'b0),
    .DOB(dob), .DOPB());
```

2048x8 512x32

```
RAMB16_S9_S36 inmem
  (// port A
    ...
  // port B
    ... );
```

Distributed RAM

- Virtex-II LUT can implement:
 - 16 x 1-bit synchronous RAM
 - Synchronous write
 - Asynchronous read
 - D flip-flop in the same slice can register the output
- Allow fast embedded RAM of any width
 - Only limited by the number of slices in each device
 - Example: RAM 64 x 12-bit fits in 48 LUTs

How to

Distributed RAM : 8 LUTs
1-adr 16x8

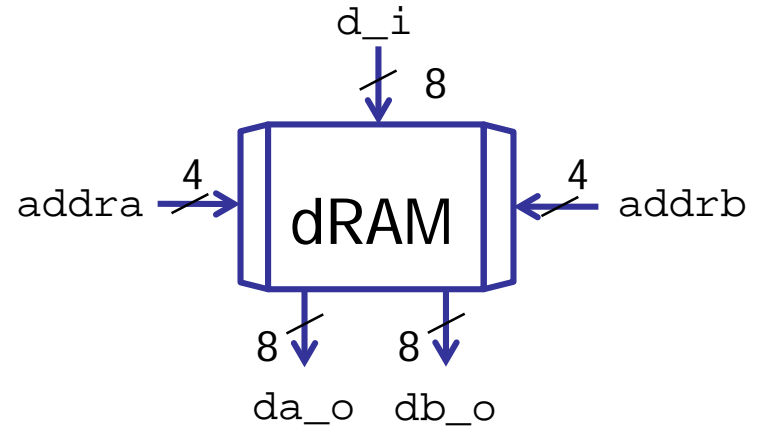

```
logic [7:0] mem0[0:15];
```

```
always_ff @(posedge clk)
    if (wr) begin
        mem0[addr] <= d_i;
    end
```

```
assign d_o=(rd) ? mem0[addr] : 8'h0;
```

Distributed RAM : 16 LUTs
2-adr 16x8

```
logic [7:0] mem0[0:15];
```

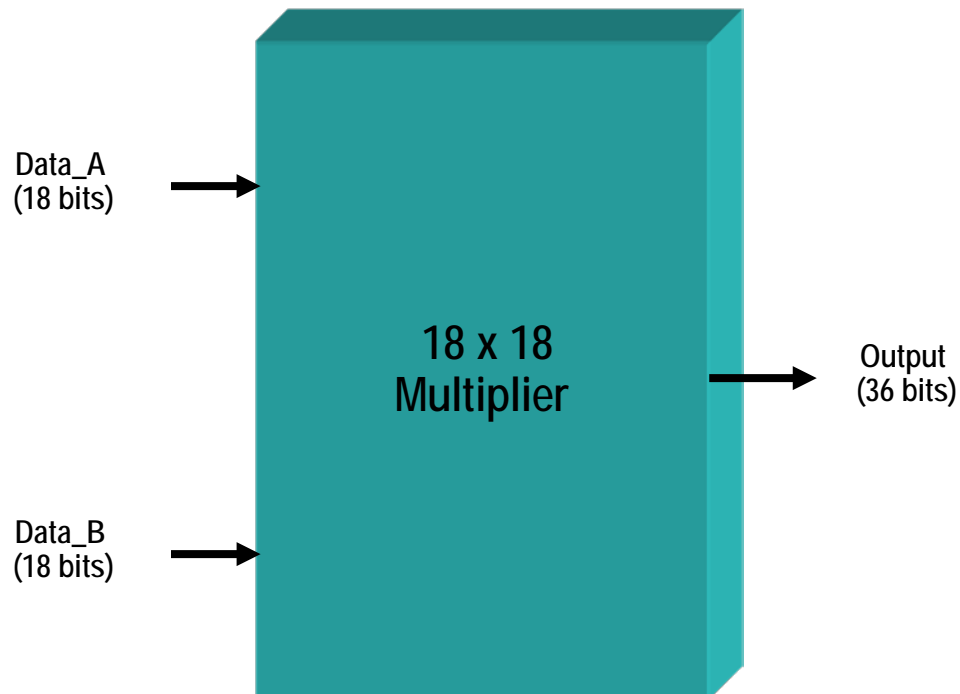

```
always_ff @(posedge clk)
    if (wr) begin
        mem0[addra] <= d_i;
    end
```

```
assign db_o = (rdb) ? {mem0[addrb]
                       : 8'h0};
```

```
assign da_o = (rda) ? {mem0[addra]
                       : 8'h0};
```

18 x 18 Multiplier

- Embedded 18-bit x 18-bit multiplier
 - 2's complement signed operation
- Multipliers are organized in columns

An example: a decade counter

```
module dec(  
    input clk,rst  
    output u);  
  
    reg u;  
    reg [3:0] q;  
  
    always_ff @(posedge clk or posedge rst)  
        if (rst)  
            q <= 4'h0;  
        else if (q == 9)  
            q <= 4'h0;  
        else  
            q <= q+1;  
  
    always_ff @(posedge clk)  
        if (q == 9)  
            u <= 1'b1;  
        else  
            u <= 1'b0;  
endmodule
```
